

BAYESIAN NETWORKS

Today

- Reading
 - AIMA Chapter 14.1-14.4

- Goals
 - Bayesian networks

- Announcements
 - Midterm exam is March 12th

Checking independence

- Are X and Y independent?

p(X,Y)		X		
		1	2	3
Y	1	0	1/6	1/12
	2	1/5	1/9	0
	3	2/15	1/4	1/18

Moving away from numerical quantities

“The traditional definition of independence uses equality of numerical quantities, as in

$$p(x, y) = p(x)p(y)$$

suggesting that one must test whether the joint distribution of X and Y is equal to the product of their marginals in order to determine whether X and Y are independent. By contrast people can easily and confidently detect dependencies, even though they may not be able to provide precise numerical estimates of probabilities. A person who is reluctant to estimate the probability of being burglarized the next day or of having a nuclear war within five years can nevertheless state with ease whether the two events are dependent, namely, whether knowing the truth of one proposition will alter the belief of the other.”

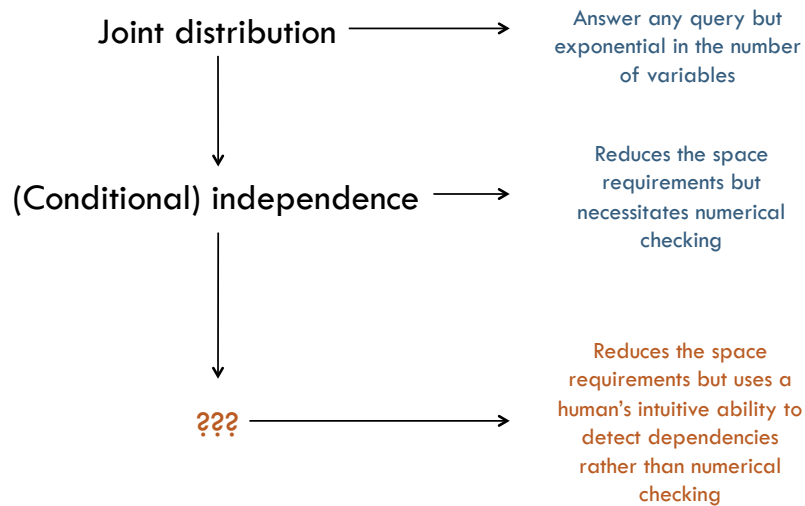

- Judea Pearl

Moving away from numerical quantities

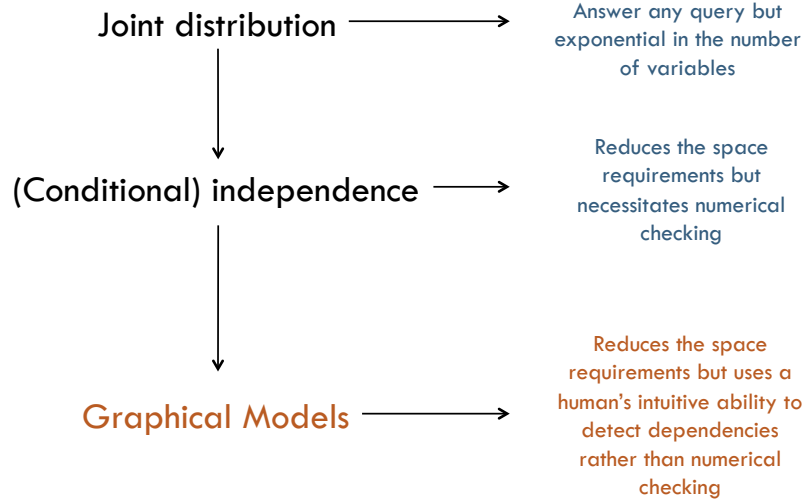

“It is usually easy for a domain expert to decide what direct influences exist in the domain – much easier, in fact, than actually specifying the probabilities themselves”

- Humans can “easily and confidently” detect dependencies
- Move away from numerical representation of the joint distribution (or the conditional distributions) to a representation that encodes dependencies

Probabilistic Inference

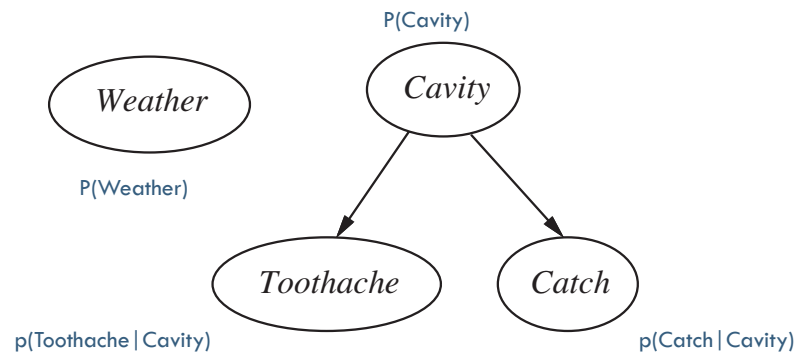

Probabilistic Inference

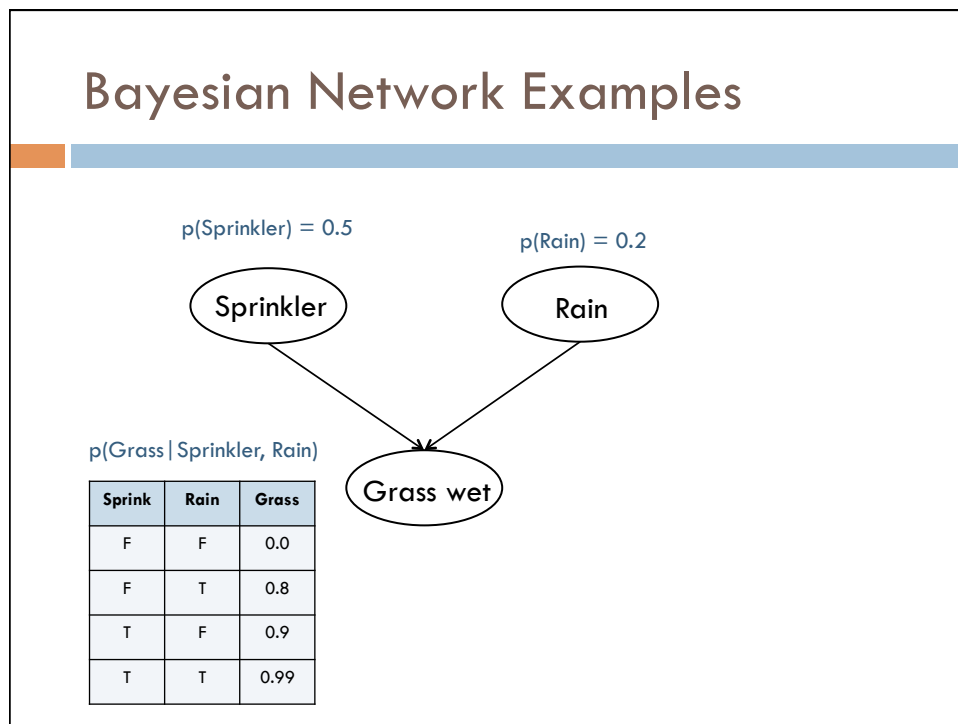

Bayesian Network Examples

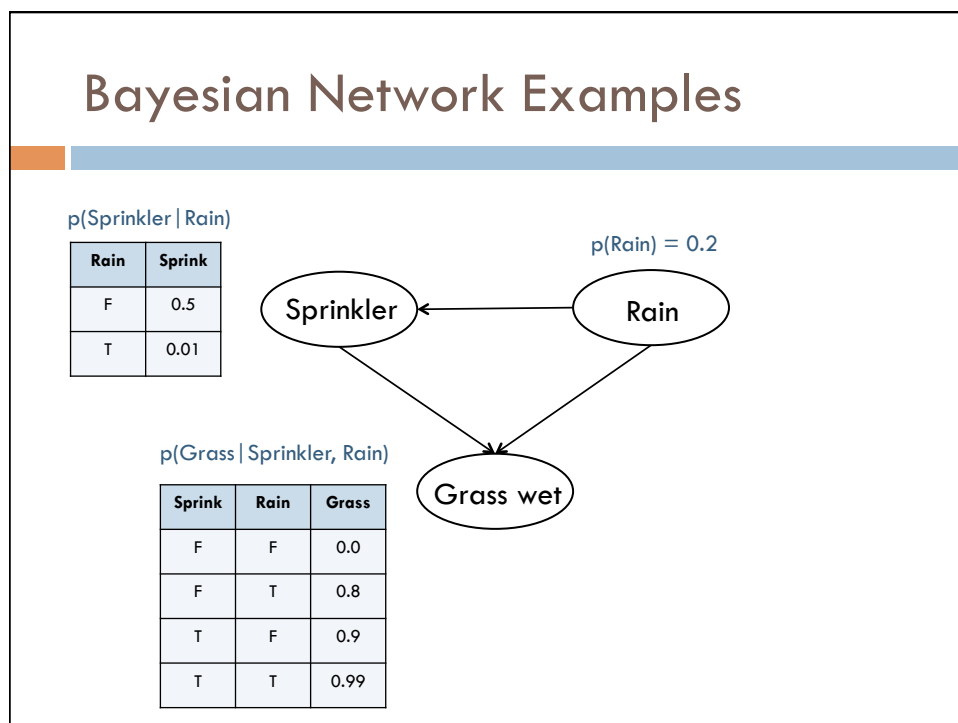

- Weather = {rainy, sunny, cloudy, snowy}
- Cavity = {yes, no}
- Toothache = {yes, no}
- Catch = {yes, no}

Bayesian Network Examples

Bayesian Network Examples

Bayesian Network Examples

Example: MammoNet

Three Types of Connections

Linear

Converging

Diverging

Connection patterns and independence

- **Linear connection:** The two end variables are dependent on each other. The middle variable renders them independent.
- **Converging connection:** The two end variables are independent of each other. The middle variable renders them dependent.
- **Divergent connection:** The two end variables are dependent on each other. The middle variable renders them independent.

D-Separation

- Algorithm to determine independencies in BN
- Query: Are two variables X_i and X_j independent?
- Check all paths between X_i and X_j
 - ▣ If all paths are blocked, then independent
 - ▣ If any path is not blocked then not independent

List the independencies in the following Bayesian Network

Bayesian Networks terminology

Independence assumptions encoded in the Bayesian Network

Local Markov Assumption:

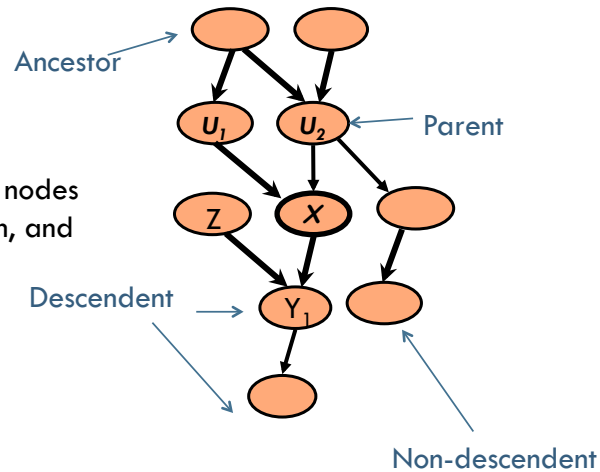

A node X is independent of its non-descendants given its parents

Independence assumptions encoded in the Bayesian Network

Markov Blanket:

A node X is conditionally independent of all other nodes given its parents, children, and children's parents

Commonly used Bayesian Networks

Naïve (Idiot) Bayes Classifier

- ▣ Commonly used for text classification
- ▣ C is the class (topic or label) of the document
- ▣ The X variables represent the words in the document

Today an earthquake occurred in Southern California...
